Cloud Computing Lab - Experiment 4 (SAMPLE)
Title: Launch a web server on Amazon EC2 and host a static website on Amazon S3
Aim: To deploy an Apache web server on an EC2 instance and host a static website using S3 static website hosting.

Take a screenshot for every step.

1. Sign in to the AWS Management Console and open the EC2 dashboard.
2. Launch an EC2 instance (Amazon Linux 2023, t2.micro) with a new key pair.
3. Configure the security group to allow SSH (port 22) and HTTP (port 80).
4. Show the instance in the Running state with its public IPv4 address.
5. Connect to the instance over SSH using the key pair.
6. Update packages and install the Apache web server (httpd).
7. Start and enable the httpd service and verify that it is running.
8. Create an index.html page and open the instance's public IP in a browser.
9. Create an S3 bucket with a globally unique name.
10. Upload index.html and error.html to the bucket.
11. Enable static website hosting and attach a public-read bucket policy.
12. Open the S3 website endpoint in a browser and show the page loading.
